

Supplementary Figure 1: Flow cytometry plots for activation data shown in Figure 8C. T2 cells were pulsed with peptide for 1 h, washed extensively then allowed to culture for 3 or 24 h before being co-incubated for 5h with T-cells from two donors transduced with the 868 TCR. CD107a and TNFα were used to establish percentage reactivity by flow cytometry. Untransduced CD8+ T-cells did not respond to peptide (data not shown).
