In the title compound, $C_{19}H_{27}F_3N_2OS_2$, the dihedral angle between the benzene ring and dithiocarbamate group is $67.00(9)^\circ$ and a weak intramolecular N—H···S interaction generates an *S*(7) ring. The *tert*-butyl group is disordered over two orientations in a $0.628(14):0.372(14)$ ratio. In the crystal, inversion dimers linked by pairs of weak C—H···O interactions generate $R_2^2(20)$ loops and the aromatic rings of neighbouring pairs of molecules are involved in very weak π — π stacking interactions [centroid–centroid separation = $4.0042(13)\text{ \AA}$].

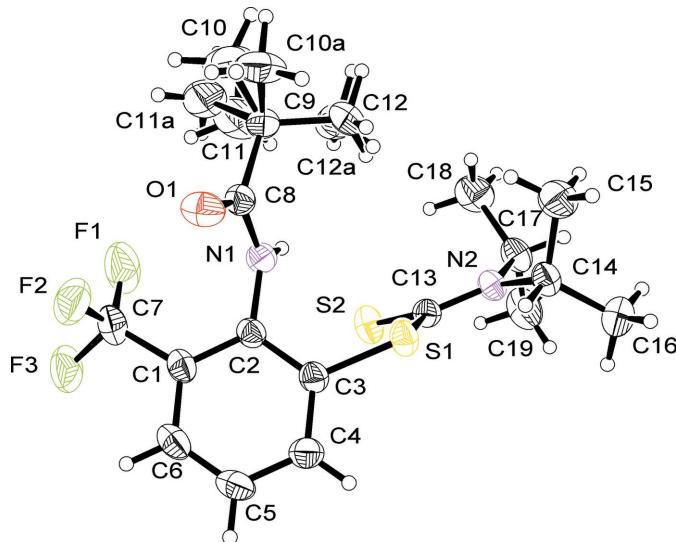

Structure description

Various *N*-(substituted phenyl)pivalamides can be substituted efficiently in reactions with lithium reagents followed by reaction with electrophiles (*e.g.*: Smith *et al.*, 2015; Smith *et al.*, 2012). Recently, the X-ray crystal structure of 4-(pivaloylamino)pyridin-3-yl *N,N*-diisopropylthiocarbamate has been published (El-Hiti *et al.*, 2014). We now describe the synthesis and structure of the title compound (Fig. 1).

An intramolecular N1—H1···S2 contact is observed (Table 1). The crystal packing is shown in Fig. 2 and features inversion dimers linked by weak C—H···O interactions and very weak aromatic π — π stacking interactions [centroid–centroid separation = $4.0042(13)\text{ \AA}$].

Synthesis and crystallization

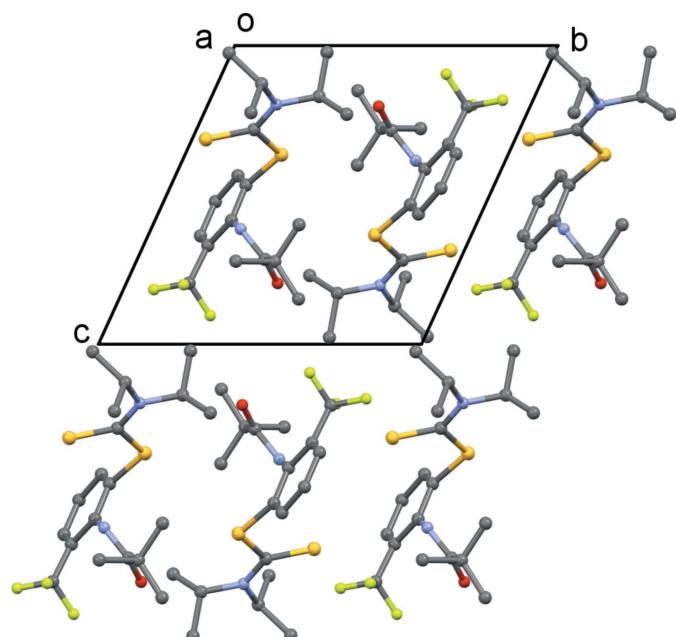

N-(2-(trifluoromethyl)phenyl)pivalamide and *n*-butyllithium (two equivalents) in anhydrous tetrahydrofuran at 0°C was reacted with tetraisopropylthiuram disulfide (one

**Figure 1**

The molecular structure, with displacement ellipsoids at the 50% probability level, showing both orientations of the disordered *tert*-butyl group.

equivalent). Crystallization of the crude product using ethyl acetate as solvent gave colourless blocks, m.p. 129–131°C.

The NMR spectrum indicates that the two *iso*-propyl groups are different, possibly due to restricted rotation about the N—C bond (Chatgilialoglu & Asmus, 1990). The NMR assignments are based on predicted chemical shifts and coupling patterns and have not been rigorously confirmed. ^1H NMR (500 MHz, CDCl_3): δ 7.84 (*d*, $J = 7.8$ Hz, 1 H, H-6), 7.74 (*d*, $J = 7.8$ Hz, 1 H, H-4), 7.72 (*br s*, exch., 1 H, NH), 7.48 (*app. t*, $J = 7.8$ Hz, 1 H, H-5), 4.99, 4.07 [2 *br*, 2 H, 2 $\text{CH}(\text{CH}_3)_2$], 1.66, 1.41 [2 *br*, 12 H, 2 $\text{CH}(\text{CH}_3)_2$], 1.31 [*s*, 9 H, $\text{C}(\text{CH}_3)_3$]; ^{13}C NMR (125 MHz, CDCl_3): δ 192.4 (C=S), 177.8 (C=O), 140.6 (C-6), 140.5 (C-1), 133.6 (*m*, C-2), 130.4 (*q*, $J = 30.1$ Hz, C-3), 129.2 (*q*, $J = 5.0$ Hz, C-4), 128.1 (C-5), 123.2 (*q*, $J = 274.0$ Hz, CF_3), 56.5, 52.7 [2 $\text{CH}(\text{CH}_3)_2$], 39.1 [$\text{C}(\text{CH}_3)_3$], 27.4 [$\text{C}(\text{CH}_3)_3$], 20.2, 19.6 [2 $\text{CH}(\text{CH}_3)_2$]; EI-MS: m/z (%) = 420 (M^+ , 12), 259 (31), 244 (72), 219 (23), 144 (80), 102 (100), 100 (41), 57 (26); HRMS (EI): calculated for $\text{C}_{19}\text{H}_{27}\text{F}_3\text{N}_2\text{OS}_2$ ($M\text{H}^+$): 420.1517; found: 420.1512.

Special details

Experimental. CrysAlisPro, Agilent Technologies, Version 1.171.37.33 (release 27-03-2014 CrysAlis171 .NET) (compiled Mar 27 2014, 17:12:48) numerical absorption correction based on gaussian integration over a multifaceted crystal model empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. All hydrogen atoms were placed in calculated positions and refined using a riding model. Methyl C—H bonds were fixed at 0.96 Å, with displacement parameters 1.5 times $U_{\text{eq}}(\text{C})$, and were allowed to spin about the C—C bond. The N—H bond was fixed at 0.86 Å and aromatic C—H distances were set to 0.93 Å and their U(iso) set to 1.2 times the U_{eq} for the atoms to which they are bonded.
